APPENDIX B. Procedure and descriptive analysis of the articles

We began by searching four scientific databases (i.e., EBSCO Host, Web of Science Core Collection, Scopus, ScienceDirect) for relevant studies. Following prior work (e.g., van Lunenburg et al. 2020), we identified keyword combinations that collectively encompass social entrepreneurship and related concepts (e.g., social innovation). We included the following keywords: “(soc* OR sustainab* OR environ* OR eco* OR green* OR ethic* OR responsib*) AND (entre* OR enter* OR inno* OR intrapren* OR idea OR invention OR “novel solution” OR organization),” “hybrid AND (entre* OR enter*),” “(soc* OR hybrid) AND (venture OR company OR firm OR business OR organization),” “community business,” “community enter*,” “ethics of innovation,” “inno* AND (SDG OR “sustainable development goals” OR “grand challenges” OR CSR OR “corporate social responsibility” OR “millennium development goals” OR “planetary boundaries”),” “innovative work behavior,” “corporate soc* inno*.” Because we aimed to scan the social entrepreneurship literature broadly, we did not add additional keywords related to the research questions (e.g., “social value” or “social change”). All articles that address our research questions are therefore a subset of articles resulting from this search. This search took place in two waves. We conducted the first wave by the end of 2018 and the second wave by 2020 to update the search. After deleting duplicates, non-English articles, articles in journals with no management or business focus and articles in journals that received a VHB-JOURQUAL 3 ranking below C, 5,745 articles remained. See <https://vhbonline.org/vhb4you/vhb-jourqual/vhb-jourqual-3/gesamtliste> for the VHB ranking, which is among the most important journal rankings in management (<https://harzing.com/resources/journal-quality-list>).

At this point, we scanned the titles and deleted articles that were not related to social entrepreneurship. Then we scanned the abstracts of the remaining articles and deleted those whose abstracts did not refer to positive effects of social entrepreneurship. For the remaining

176 articles, we checked the references (backward search) and citations (forward search), and included relevant publications in journals with at least a C ranking or articles that had been cited more than 100 times to account for important work in lower-ranked journals. We also included articles from the topic journals *Journal of Social Entrepreneurship* and *Social Enterprise Journal*. These procedures resulted in 171 additional articles.

We included such a large number of additional articles for several reasons. First, several articles related to social entrepreneurship use wordings which our database search did not capture (e.g., “social and commercial entrepreneurship,” “innovation for impact,” “sustainability-oriented”). Second, some articles were published in non-management, non-business, or non-academic journals. Third, several articles only referred to, for example, social value or entrepreneurship in their titles and abstracts without obvious links to our research questions. Only through citations of such articles in other articles did their relation to our research questions become clear, leading us to include them.

For data synthesis, we followed templates for systematic literature reviews in management research (Saebi et al. 2019, Stephan et al. 2016). We proceeded with the analysis as follows: first, one author read through each article and systematically extracted relevant descriptive information (in categories such as publication year, journal, VHB-JOURQUAL 3 journal ranking, study type, sample, sample size, sample country, sample industry) and content-related information (in categories such as innovation type, definition of [social] entrepreneurship, definition of positive societal effects, pathways to positive societal effects, theoretical lens, level of analysis). The content-related categories were derived from our research questions and the core constructs of interest. Eight coders not involved in the research project performed the same procedure for 30 articles each. By comparing the information extracted by the two coders for each article, we established that our procedure

reliably extracted relevant information for the descriptive and content-related categories. At this point, the first author extracted information from the remaining articles.

Next, from the information gathered for the content-related categories, we further identified central keywords and arguments for each article. For example, from the following excerpt, “In general, the human capital of a community is increased by SE [social entrepreneurship] efforts that provide skills training, extend formal education, arrange managerial experience, and increase exposure to entrepreneurial practices that promote self-sufficiency (Bates 1990)” (Lumpkin et al. 2018, p.29), we extracted “training and education” (a subdimension of “developing human capital and social capital”) as a pathway to social value. In this way, we generated a condensed overview of the core points of each article with reference to our research questions.

In a final step, we synthesized the findings across articles. After mapping the core points of each article, we grouped them into central constructs and pathways, and graphically related the identified dimensions to each other. This enabled us to conceptualize two core constructs of positive societal effects (i.e., social value and social change) and synthesize different pathways leading to these effects. To address our first research question, we identified six dimensions that distinguish social value and social change. To address our second research question, we identified three social value pathways with nine subdimensions, and four social change pathways with six subdimensions.

Our final sample includes 347 articles. Our analysis shows that the research field on social entrepreneurship is still quite nascent and only recently gained momentum (see Figure 1). Although articles have appeared in 100 different journals, the 10 journals with the most articles related to our topics accounted for 44 percent of our sample: *Journal of Social Entrepreneurship* (33), *Journal of Cleaner Production* (23), *Social Enterprise Journal* (20), *Journal of Business Ethics* (19), *Sustainability* (12), *Journal of Business Venturing* (11),

Entrepreneurship & Regional Development (10), *Entrepreneurship: Theory & Practice* (10), *Journal of Management Studies* (8), and *Journal of Business Research* (7) (see Figure 2).

Articles were mostly published in field journals and less in general management journals. In terms of journal ranking (see Figure 3a and 3b), most articles (139) appear in journals with a VHB-JOURQUAL 3 ranking of B, followed by “not ranked” (84) and C (76). Only 43 articles are published in journals ranked A+ or A. Similarly, most articles are published in journals ranked 2 (106) or 3 (94) according to the AJG 2018 journal ranking and only 53 articles are ranked 4* or 4. Methodologically, most articles are qualitative (175), followed by conceptual (123) and quantitative (32) (see Figure 4a). The remaining articles are based on mixed methodologies (17). Samples come most often from Europe (74), followed by Asia and the Middle East (50), and North America and the Caribbean (28) (see Figure 4b). A total of 41 articles included multiple continental regions. Research from Africa and South and Middle America seems notably absent. This is especially worrying, as developing countries would benefit from contextual research on the drivers and success factors of social innovation.

In our keyword searches, we included not only the specific terms “social innovation” and “social entrepreneurship,” but also terms that are conceptually related to social innovation. The most frequently used terms are social entrepreneurship and social innovation (224 articles) (see Figure 5a). Several articles are concerned with sustainable entrepreneurship or sustainable innovation (28) and environmental entrepreneurship or environmental innovation (18). Other types of innovation include business model innovation (6), responsible innovation (5), inclusive innovation (5) or community entrepreneurship (3). Only 4 articles specifically address corporate social innovation (or intrapreneurship).

Moreover, 7 articles focus on the micro level of analysis; 74 articles focus on the meso level; and 41 articles focus on the macro level (see Figure 5b). The remaining articles include

more than one level of analysis (225), especially the meso and macro levels (124). Only 24 of these multilevel articles span all three levels of analysis.
